

Nestivo Performance Analysis – Problem Statement

Background

Nestivo is a fictional online vacation rental platform that connects guests with hosts offering short-term accommodations across major cities worldwide. Similar to Airbnb, the platform supports multiple property types, room categories, and hosts while serving millions of guest interactions through bookings and reviews.

As Nestivo expands its marketplace across global destinations, leadership requires a centralized analytics solution to monitor platform growth, understand market concentration, evaluate pricing strategies, measure guest satisfaction, and assess host trust. Without an integrated reporting system, identifying high-performing cities, monitoring service quality, and making data-driven strategic decisions becomes increasingly challenging.

Current business challenges include:

- Leadership lacks a unified dashboard that combines platform scale, growth, pricing, customer satisfaction, and trust metrics into a single executive view.
- Business managers cannot quickly identify which cities contribute the most listings or determine whether marketplace supply is overly concentrated.
- Pricing teams need better visibility into pricing differences across accommodation types to support revenue optimization and market segmentation.
- Customer Experience teams require a simple way to compare guest ratings across cities and identify the service dimensions affecting overall satisfaction.
- Operations teams need insights into seasonal demand patterns to support localized planning instead of relying on a single global strategy.
- Trust & Safety teams require visibility into host verification levels and profile completeness to strengthen customer confidence and platform security.

To address these challenges, Nestivo has commissioned an interactive Power BI dashboard that provides executives and business teams with a comprehensive view of marketplace performance, customer experience, pricing behaviour, and host trust, enabling faster and more informed business decisions.

Your Role

As the **Data Analyst / Power BI Developer**, your responsibilities are to:

- Clean and transform the Nestivo dataset using Power Query.
- Design an optimized data model for analytical reporting.
- Create DAX measures for KPIs, pricing analysis, ratings, and trust metrics.

- Develop a fully interactive multi-page Power BI dashboard consisting of:
 - Executive Overview
 - Ratings & Reviews
 - Design intuitive navigation using bookmarks and page navigation buttons.
 - Build visuals that allow both executive-level monitoring and city-level performance analysis.
 - Translate raw marketplace data into meaningful business insights and strategic recommendations.
 - Produce documentation explaining dashboard functionality, business insights, and report interpretation.
-

Problem Statement 1 – Executive Overview Requirements

The Executive Overview dashboard should provide leadership with a complete understanding of Nestivo's marketplace performance, operational scale, and pricing strategy.

Specifically, the dashboard should answer the following business questions:

1. Platform Scale & Growth

- Total Listings
- Total Hosts
- Total Cities
- Total Property Types
- Total Reviews
- Yearly Listing Growth Trend
- Growth Pattern over Time

2. Market Concentration

- Which cities contribute the largest share of listings?
- What percentage of total listings comes from the Top 3 cities?
- What percentage comes from the Top 5 cities?
- Is marketplace supply concentrated or evenly distributed?

3. Pricing Analysis

- Average Price by Room Type
- Compare Hotel Rooms, Entire Places, Shared Rooms and Private Rooms.
- Identify premium and budget accommodation segments.

- Understand pricing opportunities across different stay categories.
-

Problem Statement 2 – Ratings & Reviews Requirements

The Ratings & Reviews dashboard should help business leaders evaluate customer satisfaction, operational quality, seasonal demand, and host trust.

Specifically, the dashboard should answer:

1. Guest Satisfaction

- Which cities receive the highest overall ratings?
- Which cities underperform?
- Compare city performance using overall rating scores.

2. Detailed Rating Analysis

Analyse customer ratings across:

- Accuracy
- Cleanliness
- Communication
- Location
- Value

Determine which dimensions contribute most to higher or lower guest satisfaction.

3. Review Seasonality

- Analyse monthly review patterns.
- Compare seasonal behaviour across major cities.
- Identify differences between European and non-European markets.
- Support localized operational and marketing planning.

4. Host Trust Analysis

Evaluate host credibility using:

- Profile Picture Availability
- Identity Verification
- Fully Verified Hosts
- Anonymous / Unverified Hosts

Determine whether the platform maintains a healthy trust ecosystem and identify opportunities to strengthen customer safety.

Deliverables & Acceptance Criteria

The completed solution must provide:

- A fully interactive Power BI dashboard consisting of an Introduction page, Executive Overview page, and Ratings & Reviews page.
- Executive KPI cards summarizing platform performance.
- Interactive navigation between dashboard pages.
- Dynamic visualizations showing growth trends, market concentration, pricing, ratings, seasonality, and trust metrics.
- Business insights that explain what each visualization indicates rather than displaying raw numbers alone.
- A professional dashboard layout suitable for executive presentations.
- Documentation describing dashboard objectives, KPIs, visuals, and business recommendations.
